Description

iPlotter is a digital ink jet plotter using “drop on demand” technology, designed specifically for printing on glass sheet using specific inks, used to reproduce drawings, images and photographs for the architecture, automotive and furnishing sectors. A dedicated hydraulic system maintains the ink in circulation and a battery of filters eliminates impurities and air bubbles, thus avoiding obstruction of the nozzles and reducing machine downtime in almost total cases. The latest generation print head with drop size management allows to obtain high resolution photographic prints and high gradient contrasts. The standard is four-colour printing (CMYK) while the electronics and software have been implemented to use up to eight colour print types.
