

Lamix

Glass lamination machinery

Description

LAMIX is Keraglass's new multi-level kiln for glass lamination, designed to ensure maximum ease of use, consistent quality, and outstanding versatility.

It is a compact and cost-effective solution, ideal both for companies approaching glass lamination for the first time and for those looking to expand their production with a reliable and intuitive system.

Equipped with a lamination chamber and an operator-side control panel, it ensures continuous monitoring and safe, immediate operation.

Special attention has been given to space optimization: the retractable elevator integrated beneath the kiln, the rear-mounted electrical cabinet, and the three-level storage rack positioned above the machine maximize operational efficiency and make the most of the available production space.
